

# UltraSelective

# UltraSmooth

# UltraSound

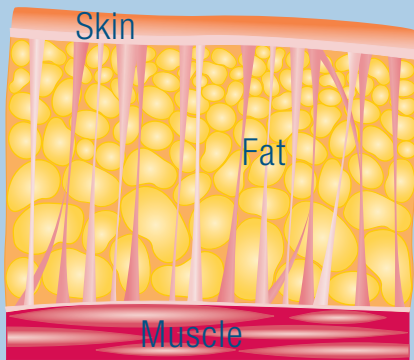

The VASER LipoSelection® procedure removes fatty tissue, while leaving blood vessels and nerves minimally disturbed.

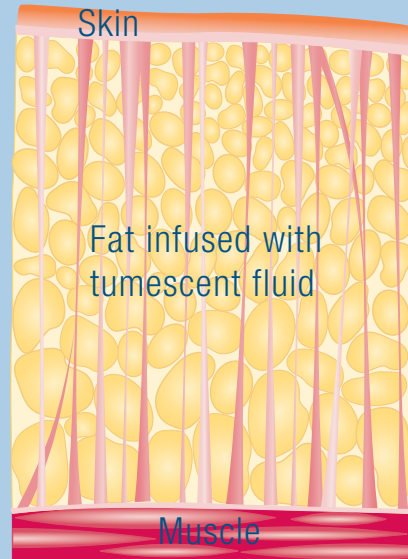

Because fatty tissue is broken up and emulsified before being removed, VASER LipoSelection leaves behind connective tissue critical to optimal recovery and smooth results.

- Smooth, predictable results
- Low to minimal pain and bruising
- Precise enough to be applied to delicate areas

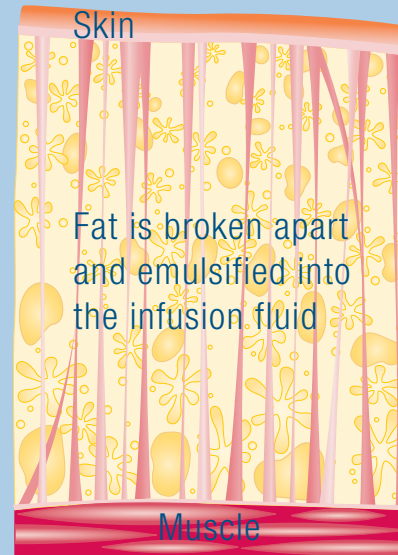

# What happens during the procedure?

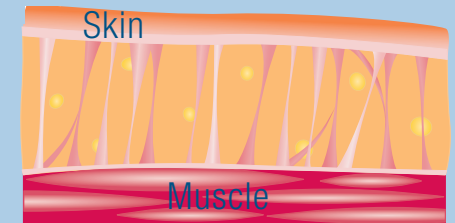

Layer of fat composed of fat cells and vascular and connective tissues

A saline solution mixed with lidocaine and epinephrine is infused

Fat is permanently destroyed during LipoSelection

Emulsified fat is easily removed with suction or massage
